## ABSTRACT

Politics is the basic policy of the state administration that is currently and will apply, which is sourced from the values that apply in society to achieve state goals. The purpose of government-run politics is to achieve the welfare of the general public. Elections are a form of political participation as an embodiment of people's sovereignty, because at the time of voting, the people become the most decisive party for the political process in an area by voting directly. This study aims to determine whether the influence of the Political Marketing Mix on the decision to choose repeat voters in General Elections in Indonesia (a case study on FEB students, Universitas Riau). This study applied quantitative research method. The analysis technique used is multiple linear regression with the test equipment using Warp PLS 7.0. The number of samples to be taken as many as 145 respondents with purposive sampling method. The data was collected by distributing online questionnaires. Based on the results of the study, it was found that: 1) Political products have a significant effect on voting decisions. 2) Political Promotion has a significant effect on the Decision to Choose. 3) Political Price has a significant effect on the Decision to Choose. 4) Political distribution has a significant effect on voting decisions.

**KEYWORDS** political marketing mix; voting decisions; repeat voter

#### **INTRODUCTION**

Politics is the basic policy of administering the state which is currently and will apply, which originates from the values prevailing in society to achieve state goals (Pramono, 2018; Qurbani, 2012). The purpose of government-run politics is to achieve the welfare of the general public. Presidential elections are a form of political participation as a manifestation of people's sovereignty, because at the time of voting, the people become the most decisive party to the political process in an area by voting directly (Filan & Firdaus, 2022).

Citizens' political awareness is an important factor in political participation, meaning that it is related to knowledge and awareness of rights and obligations related to the community environment and political activities being the measure and level of someone involved in the process of political participation (Averus & Alfina, 2020; Nanda, 2017). The experience of general elections in Indonesia which have taken place over several decades shows that many voters do not vote (Ta'dung, 2017). As a phenomenon described above, if someone has high political awareness and trust in the government, then political participation tends to be active, whereas if awareness and trust are very small, then political participation becomes passive and apathetic (Saputra, 2017).

Data from We The Youth shows that in the 2014 election there were 24.89 percent of voters who decided to abstain (Shofi et al., 2020). In the 2019 election, the General Election Commission recorded the number of permanent voters under the age of 20 as many as 17.5 million people, and voters aged 21 to 30 as many as 42.84 million people. In total, the number of voters aged less than 20 years and 21-30 years reached 60.34 million people. The total number of permanent voters for the 2019 election is 192 million. This means that 31.4 percent of voters in the 2019 election are young people.

Table 1. Number of Voters by Age in the 2019 Election

Source: Tempo.co

The Alvara Research Center survey also explains why young people are the biggest contributors to abstentions (Silalahi, 2019). First, it could be because they are not very active in following political news. Second, they tend to be apathetic towards political processes. Third, their knowledge related to politics is not too great. More specifically, based on data from the Riau Provincial Election Commission in 2019, it shows the high number of abstentions in Riau. This can be seen from the data on voters in the DPT who do not exercise their right to vote. The following details the data that the author presents.

Table 2. Data on the number of voters and abstentions from the 2019 Riau **Province election** 

Source: KPU Riau Province, 2019

The high potential of voters among young people, especially repeat voters with the dark side of indifference to elections, creates a big challenge and homework for political parties and candidates to convince and get young people to wake up to vote. This makes the candidates must have a pattern to market themselves. Moreover, this study aims to determine whether the influence of the Political Marketing Mix on the decision to choose repeat voters in General Elections in Indonesia (a case study on FEB students, Universitas Riau).

#### **RESEARCH METHOD**

#### **Research sites**

This quantitative research was conducted at the Faculty of Economics and Business, Universitas Riau.

#### **Population and Sample**

In this study, the population was all active FEB students at the Universitas Riau. The sample in this study used a nonprobability sampling method with a purposive sampling method, namely sampling based on certain criteria.

Determination of the number of Representative samples depends on the number. The number of indicators is multiplied by 5 to 10 (Ferdinand, 2014). So the number of representative samples in this study is: 29x5=145. The criteria set by the researcher in the sampling study are:

- 1) Active student of FEB, Universitas Riau
- 2) Have been a repeat voter (using their right to vote at least 2 times to elect both the President and Vice President, DPR/DPRD, Regent and/or Mayor election.

#### Data analysis

The data analysis used is Multiple Regression Analysis using WarpPLS version 7.0 software. PLS analysis has two models, namely the outer model and the inner model. The outer model (measurement model) specifies the relationship between variables and their indicators. Meanwhile, the inner model (structural model) specifies the relationship between latent variables, namely between exogenous/independent variables and endogenous/ dependent variables (Ghozali, 2008).

Data Quality Test (Outer Model) Convergent Validity Test Table 3. Data Quality Test (Outer Model) Convergent Validity Test

Source: Research Processed Results, 2021

In the table above it can be seen the value of the loading indicator or loading factor construct of each variable. It is known that all indicators have a loading factor value above 0.7. Then also obtained an average variance extracted (AVE) value above 0.50 which means that all the reflective indicators above have a correlation with the construct variable. This explains that all indicators in the variable construct meet the convergent validity requirements.

Table 4. Results of Discriminant Cross Loading Validity Test of Research Variables

Source: Research Processed Results, 2021

In the table above it can be seen that the correlation value of all indicators from each construct has a high correlation with the construct variable. This explains that all indicators in each construct variable meet the discriminant validity requirements.

| Table 5. Validity Test of AVE Square Roots             |       |       |       |       |       |  |  |
|--|-------|-------|-------|-------|-------|--|--|

Source: Research Processed Results, 2021

In the table above it can be seen that the square root value of AVE along the diagonal line has a greater correlation between one construct and another so it can be concluded that the construct has a good level of validity.

Source: Research Processed Results, 2021

In the table above it can be seen that all the values of Cronbach's alpha construct variables are above 0.70. This explains that all construct variables meet the reliability requirements.

| Table 7. Composite Reliability Results |                          |          |             |  |  |  |

In the table above it can be seen that all values of the composite reliability of the construct variables of the research variables are above 0.70. This explains that all construct variables meet the reliability requirements.

# **Structural Model Testing (Inner Model)**

| Table 8. R – Square results              |                           |                                    |  |  |  |  |
|--|---------------------------|------------------------------------|--|--|--|--|
| Model structure                          | R-squared<br>Coefficients | Adjusted R-squared<br>Coefficients |  |  |  |  |
| Decision                                 | 0.632                     | 0.622                              |  |  |  |  |
| Source: Research Processed Results, 2021 |                           |                                    |  |  |  |  |

In the table above, it can be obtained that the value of Adjusted R Square for the decision-making variable is 0.622. This means that 62.2% of the voting decision variable is influenced by product, promotion, price and political distribution. While the remaining 37.8% is influenced by other variables not included in this study.

| Table 9. | Value of | of Fit | Indicators | and | Ouality | Indexes |
|----------|----------|--------|------------|-----|---------|---------|
|          |          |        |            |     | ~~~~    |         |

| Average Average path coefficient (APC)=0.247, P<0.001 Average R-squared (ARS)=0.632, P<0.001 Average adjusted R-squared (AARS)=0.622, P<0.001 |
|---|
| block VIF (AVIF)=1.691, acceptable if <= 5, ideally <= 3.3  |
| Average full collinearity VIF (AFVIF)=1.860, acceptable if <= 5, ideally <= 3.3   |
| Tenenhaus GoF (GoF)=0.642, small >= 0.1, medium   |
| >= 0.25, large >= 0.36  |
| Sympson's paradox ratio (SPR)=1.000, acceptable if  |
| >= 0.7, ideally = 1   |
| R-squared contribution ratio (RSCR)=1.000, acceptable if >= 0.9, ideally = 1  |
| Statistical suppression ratio (SSR)=1.000, acceptable if >= 0.7   |
| Nonlinear bivariate causality direction ratio (NLBCDR)=1.000, acceptable if >= 0.7  |

Source: Research Processed Results, 2021

- Average path coefficient (APC) The average path coefficient (APC) value was obtained of 0.247 with a p-value <0.001, so it can be interpreted that the research model has good fit.</li>
- Average R-squared (ARS) The average R-squared (ARS) value is 0.632 with a p-value <0.001, so it can be interpreted that the research model has a good fit.
- 3) Average adjusted R-squared (AARS) An average adjusted R-squared (AARS) value of 0.622 was obtained with a pvalue <0.001, this could mean that the researcher's model had good fit.</p>
- 4) Average block VIF (AVIF) & Average full collinearity VIF (AFVIF)

The average variance inflation factor (AVIF) value is 1.691 and the average full collinearity variance inflation factor (AFVIF) is 1.860 < 3.3, which means that there is no multicollinearity problem between indicators and between exogenous variables.

5) Tenenhaus GoF (GoF)

The tenenhaus goodness of fit value was obtained of 0.642 > 0.36 which indicates that the predictive power of the model is large or the fit model is very good.

6) Sympson's paradox ratio (SPR), R-squared contribution ratio (RSCR), Statistical suppression ratio (SSR), Nonlinear bivariate causality direction ratio (NLBCDR)

To evaluate the quality indexes, the Symson's paradox ratio (SPR) index is 1,000 > 0.70 (ideal), the R-squared contribution ratio (RSCR) is 1,000 > 0.90 (ideal), the statistical suppression ratio (SSR) is 1,000 > 0.70 (ideal) and the nonlinear bivariate causality direction ratio (NLBCDR) value is 1,000 > 0.70 which means that the indices have no causality problem in the model.

Table 11. Hypothesis test results

Source: Research Processed Results, 2021

H1: A path coefficients value of 0.294 is obtained, which means that for every 1 unit increase in perceptions of political products, the decision to vote will increase by 0.294 and vice versa assuming other variables are constant. Then a p value <0.001 is obtained, which means that political products have a significant effect on voting decisions.

H2: A path coefficient value of 0.176 is obtained, which means that every 1 unit increase in perceptions of political promotion will increase the decision to vote by 0.176 and vice versa assuming other variables are constant. Then obtained a p value of 0.014 <0.05 which means that political promotion has a significant effect on the decision to vote.

H3: A path coefficients value of 0.308 is obtained, which means that for every 1 unit increase in perceptions of political prices, then it will increase the decision to choose by 0.308 and vice versa assuming other variables remain. Then a p value <0.001 is obtained, which means that political prices have a significant effect on the decision to vote.

H4: A path coefficients value of 0.208 is obtained, which means that each increase in perception of political distribution by 1 unit will increase the decision to vote by 0.208 and vice versa assuming other variables are constant. Then a p value of 0.005

<0.05 is obtained, which means that political distribution has a significant effect on voting decisions.

#### CONCLUSION

Based on the result of study, the conclusion are; (1) political products have a significant effect on the decision to elect repeat voters in general elections in Indonesia, a case study on FEB students at the Universitas Riau, (2) political promotion has a significant effect on the decision to elect repeat voters in general elections in Indonesia, a case study of FEB students at the Universitas Riau, (3) political prices have a significant effect on the decision to vote for recurring voters in general elections in Indonesia, a case study on FEB students at the Universitas Riau, and (4) political distribution has a significant effect on the decision to elect repeat voters in general elections in Indonesia, a case study on FEB students at the Universitas Riau.

Moreover, this research is expected to be a reference and basis for further research. For those who want to do further research, they can add other variables that can influence the decision to choose, such as social media, promotion mix, and others so that the results obtained are even better. Because in this study, 62.2% of the voting decision variables were influenced by product, promotion, price and political distribution. While the remaining 37.8% is influenced by other variables not included in this study.
